RESEARCH INTERESTS

Previously, my research interests focus on how to optimize model inference capability through control of the intermediate process, including generating an explanation graph for the predictions (*EG3P*), allowing the model to perform explicit reasoning on complex heterogeneous data by executing (*HProPro*), and optimizing the policy model by estimating intermediate values, from the perspective of Q-Learning (*DVO*).

My current research interests center on designing model structures inspired by the division of human brain regions. Specifically, this work encompasses three key areas: the training mechanisms of autoencoders, the construction of concept models, and strategies for memory management.
